

Validation of parcel data before saving (validateParcel)

The method adopts the same parameters as parcel saving. It does not, however, perform a save but rather verifies the correctness of data together with the recipient's address and requirements of fields.

Method name:

public ParcelResultApiBean validateParcel(ParcelApiBean parcelApiBean, String apiKey)

throws MeestException;

Validation includes:

Required fields and correct address of the recipient:

- recipientAddress.cityIdRef if city exists
- if filled in recipientAddress.street.name, if it exists, if unique
- recipientAddress.name
- recipientAddress.country
- recipientAddress.house
- recipientAddress.phone

Required fields and correctness of fields of the parcel and option of delivery:

- parcelNumberInternal
- deliveryTypeEnum
- divisionIdRef jeli wybrany SERVICE_POINT,POSTAL_SERVICE_APT
- weight of the parcel at the delivery point possible message parcel.weight.is.greater.than.selected.division.weight
- weight
- value
- summa.cod.eur
- summa.cod.uah
- receiver.name
- receiver.email
- currency

Required fields and correctness of parcel's items

- name
- nameUk
- productEan
- productSize
- weight
- count
- value
- valueUah
- country.code
- custom.code

Example of use:

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
